Outline

Architecture: <https://w3c.github.io/wot-architecture/>

- Should requirements be moved out of this document?
- Are there any use cases in Architecture that are not in use cases and requirements document?
- Should architecture be normative?
- If not, what do we do about assertions?
 - <https://w3c.github.io/wot-architecture/testing/report11.html>
 - 54 assertions total
 - 28 are security or privacy related
 - 26 are generally related to TD/TM metadata, some to discovery

Proposal: Architecture

1. Move requirements to Use Cases and Requirements
 - Convert to appropriate format, e.g. user stories
 - Means we will consolidate functional and technical requirements
 - Move Security and Privacy assertions to other normative documents, e.g. TD or Discovery, as appropriate.
2. Remove or move assertions to appropriate documents
 - <https://w3c.github.io/wot-architecture/testing/report11.html>
3. Rewrite text to focus on role as explainer and guide
 - Target audience: management, prospective users
 - Keep application domains and patterns
4. Publish as a Note

Discussion

- Need a TF lead...
 - A fair amount of work needed
- If we do not refactor we still need to update to reference new TD specifications, e.g. TD 2.0.
 - Do trivial changes such as this require re-testing?
